

# CompsFromSpreadsheet version 5

## Sample Project

Here is a sample projects that you can run CompsFromSpreadsheet on. To process the project using the script, open the project, go to window and select *compsFromSpreadsheet5.jsxbin* to open the script (assuming you already installed the script on your system).

With the sample project open push the *Run compsFromSpreadsheet* button. A window will pop up asking you to select your grid file. There are two grid files (tab delimited text files) in the *Sample Project* folder. The *Data.txt* file will create 10 compositions with data and will set the output module and render settings for each new comp. The *DataNoOutputModule.txt* text file will do the same thing as *Data.txt* but does not set render settings and output module.

After you select either text file the field init window opens up. The fields will already be synced to your template comps. The only thing you need to do is tell the script where all your import files are (they are in the *assetts* folder in your *Sample Project* folder). Click on the *Set Import Path* button. A window will open up asking you to set the import path, navigate to the *assetts* folder and click ok. The script will create 10 new comps based on the text file you chose, and it will put all the new comps in a folder named *compsFromSpreadsheet* in your project window
