

CompsFromSpreadsheet

Version 5.1 New Features

CompsFromSpreadsheet version 5.1

New Features

Interface changed to accommodate spreadsheets with many columns. If your spreadsheet has a lot of columns, eventually the field init window runs out of space. Now there is a scrollbar when using many columns.

Double quotes apparently get mangled by excel when you convert to tab delimited text. Now if you put <qq> in your spreadsheet, the script will convert it to “

If you want to update your template comps without duplicating them, there is a checkbox in settings->processing “Don’t Duplicate Template and Pre Comps”. When checked the script will not duplicate comps or precomps instead working on the original template comp and precomps

You can now import an image sequence by appending a * instead of > in the layer name. Previously if you tried to import an image sequence, only the first frame would come in.

Fixed issues with saving render to an image sequence and other issues with render settings.

Fixed “undo group mismatch” bug.
